Graphene synthesis project update

1. Biochar synthesis

- Overall seven syntheses finished with hemp fibers from BAFA neu GmbH
 - three syntheses done with 0.02M sulfuric acid
 - first product not representative, not used further
 - second and third batch converted (see below)
 - four syntheses done with 0.10M sulfuric acid
 - very similar observations and outputs
 - products of these have been combined/homogenized
 - part of the combined lots has been converted
- Canadian Rockies Hemp arrived and cleared customs
 - several standard synthesis batches finished, seven of these (11.2 g) combined and homogenized
 - additional experiments done with higher concentrated sulfuric acid (1.5%, 2.0%, 5.0%)
 - one experiment performed under stirring, using cut up hemp fibers, product is finer and more homogeneous
 - one experiment performed with sulfuric acid pre-treatment of hemp (95 °C)
- Larger vessel reactivated, production ongoing (approx. 15 g output per batch)
- Typical moisture content 5% by KFT. Further drying at 100 °C under nitrogen stream decreases KFT result to 2%. Relevance unclear – being tested in step 2.
- Corrosion/cleaning test for large-scale equipment completed successfully, first formal meeting with pilot plant staff held
- Biochar found to be hygroscopic, drying at 40 °C results in 2% water, but content increases to approx. 5% upon standing under air
