

July 30th 2024

Graphene synthesis project update

(Update shared by Daniel Borowski as temporary stand-in for Torsten Busch during cw31 to cw33)

1. Biochar synthesis

- Overall seven syntheses finished with hemp fibers from BAFA neu GmbH
 - three syntheses done with 0.02M sulfuric acid
 - first product not representative, not used further
 - second and third batch converted (see below)
 - four syntheses done with 0.10M sulfuric acid
 - very similar observations and outputs
 - products of these have been combined/homogenized
 - part of the combined lots has been converted
- Canadian Rockies Hemp arrived and cleared customs
 - several standard synthesis batches finished, seven of these (11.2 g) combined and homogenized
 - additional experiments done with higher concentrated sulfuric acid (1.5%, 2.0%, 5.0%)
 - one experiment performed under stirring, using cut up hemp fibers, product is finer and more homogeneous
 - one experiment performed with sulfuric acid pre-treatment of hemp (95 °C)
- Larger vessel reactivated, first production batch completed (14.9 g output)

2. Biochar analysis

- Sample of combined biochar (milled, MB2946X_gem) analyzed by SEM and Raman for reference

3. Graphene synthesis

- two experiments finished with steep heating ramp (20-30 °C/min)
 - biochar ground manually for first experiment (TB1131)
 - laboratory mill used for second experiment (TB1132)
 - products not yet characterized
 - no serious handling issues
- two experiments performed with much gentler heating ramp (3 °C/min, TB1133/1134)
 - better handling but no other apparent difference
- one experiment performed at 5 °C/min (MB2946)

-
- 2 g of combined biochar milled with 2 g of KOH and used for several batches on 0.25 g scale
 - 800 °C, 1 h: minimal yield (MB2947A)
 - 800 °C, 2 h: minimal yield (MB2947B)
 - 800 °C, 3 h: no output (MB2947C)
 - ➔ Inertion apparently insufficient and material likely incinerated
 - 800 °C, 3 h repeat, much higher Ar stream: 38 mg output obtained (MB2947D)
 - 800 °C, 1 h, nitrogen inertion: 60 mg output (TB1135-1)
 - 800 °C, 1 h, increased nitrogen inertion: 70 mg output (TB1135-2)

 - 2 g of combined biochar milled with 2 g of KOH and used for several batches on 0.25 g scale
 - 800 °C, 2 h, inertion equivalent to TB1135-2: 70 mg output (MB2952B)
 - 800 °C, 3 h, inertion equivalent to TB1135-2: 50 mg output (MB2952C)
 - ➔ smoldering observed upon contact of the cold material with air (see video)
 - 800 °C, 3 h, inertion equivalent to TB1135-2: 60 mg output (MB2952C2)
 - ➔ material wetted with water before/during removal from the apparatus

 - Oxygen sensor shows complete inertion of apparatus within 3 minutes at selected nitrogen stream (equivalent to TB1135-2)

 - 2 g of combined biochar milled with 3 g of KOH and used for several batches on 0.25 g scale
 - 800 °C, 1 h, standard inertion: Quartz tube shattered, only 7 mg output (MB2955A)
 - 800 °C, 1 h, standard inertion (repeat of MB2955A): 90 mg output (MB2955A2)
 - 800 °C, 2 h, standard inertion: 80 mg output (TB1136)

 - 2 g of combined biochar milled with 4 g of KOH and used for several batches on 0.25 g scale
 - 800 °C, 1 h, standard inertion: 80 mg output (MB2962A)
 - 800 °C, 2 h, standard inertion: 90 mg output (MB2962B)

 - 0.6 g of biochar (cut up, hydrolyzed under stirring) milled with 0.6 g of KOH and used for two batches on 0.2 – 0.3 g scale
 - 800 °C, 1 h, standard inertion: 70 mg output (MB2963A)
 - 800 °C, 2 h, standard inertion: 120 mg output (MB2963B)

 - 2 g of combined biochar milled with 8 g of KOH and used for several batches on 0.25 g scale
 - 800 °C, 1 h, standard inertion: 60 mg output (TB1137-1)
 - 800 °C, 2 h, standard inertion: 60 mg output (TB1137-2)
 - 800 °C, 1 h, standard inertion: 70 mg output (TB1137-3)

 - 2 g of biochar lot MB2959 milled with 12 g of KOH and used for several batches
 - 800 °C, 1 h, standard inertion: 24 mg output (MB2965A)
 - 800 °C, 2 h, standard inertion: 13 mg output (MB2965B)
 - 800 °C, 2 h, standard inertion (oven B): 7 mg output (MB2965B2)

 - 2 g of biochar lot MB2959 milled with 8 g of KOH and used for several batches
 - 800 °C, 1 h, standard inertion: 52 mg output (MB2966A)
 - 800 °C, 2 h, standard inertion (oven B): 46 mg output (MB2966B)
-

- 1.2 g of biochar lot MB2964 milled with 4.8 g of KOH and used for several batches
 - 800 °C, 1 h, standard inertion: 57 mg output (MB2967A)
 - 800 °C, 2 h, standard inertion (oven B): 42 mg output (MB2967B)

- 1.4 g of biochar lot MB2957 (from 1.5% H₂SO₄) milled with 2.1 g of KOH and used for several batches
 - 800 °C, 1 h, standard inertion: in progress (MB2970A)
 - 800 °C, 2 h, standard inertion (oven B): in progress (MB2970B)

4. Graphene analysis

- SEM (and partially Raman) results available for
 - TB1133, MB2946A, MB2947D, TB1135-1, TB1135-2, MB2952B, MB2952C, MB2952C2, MB2955A, MB2955A2, TB1136, MB2962A/B, MB2963A/B, TB1137-1/2/3 (step 2 products), MB2965B, MB2965B2, MB2966A/B, MB2967A/B
- 900561-500MG (Sigma-Aldrich reference)
- 924458-500MG (Sigma-Aldrich reference "Single-layer graphene sheets for battery, Bio- sourced")
- NDA with TEM/BET provider signed, shipment of first sample in progress

5. Currently open questions

- discussion started with Clariant lab on **particle size analysis** regarding method (laser diffraction?) and required sample quantities.
- **rotating oven** to be purchased? Discuss path forward.
- **pellet press** from Curia storage available. To be evaluated: contact of biochar/KOH mixture to atmospheric humidity while under processing in pellet press. Nitrogen blanketing under discussion.

Planned experiments:

- KOH/biochar 1.5 : 1 with several different step 1 batches (using varying conc. of sulfuric acid: 1.5%, 2.5%, 5%).
- Milling time 1 min vs. 5 min using biochar from big batch
- 700 °C and 750 °C max. temperature vs. 800 °C in typical experiments
- Pre-mill biochar-only, then addition of KOH and further milled.
- Titration of KOH in biochar/KOH mixtures after milling to determine recovery
- Addition of water: prepare suspension of biochar in aqueous KOH and subject to step 2
- Addition of water: add small quantity of water to milled KOH/biochar mixture to simulate influence of atmospheric humidity
- KOH/biochar 0.5 : 1 (not tested so far)
- Use KOH/biochar pellets in step 2 (improved contact between KOH and biochar in dense pellets?)
- Step 1 material required for further testing: repeat step 1 big batch

Experiment overview – Step 1

Experiment	Reactor	Raw material			Acid			T	t	pressure		Wash		Output		
MB2928	AV1	6.0 g	BAFA neu Hemp Fibre VF	100.0 g	0.19%	0.02 M	Sulfuric acid	180 °C	22.5 h	8.7 bar	-> 10.4 bar	742 g	Water	2.6 g		
Comment	Fibres not completely covered by liquid
